

If - Else statements

The fundamental control structure

If statement:

Only evaluated if
condition is true

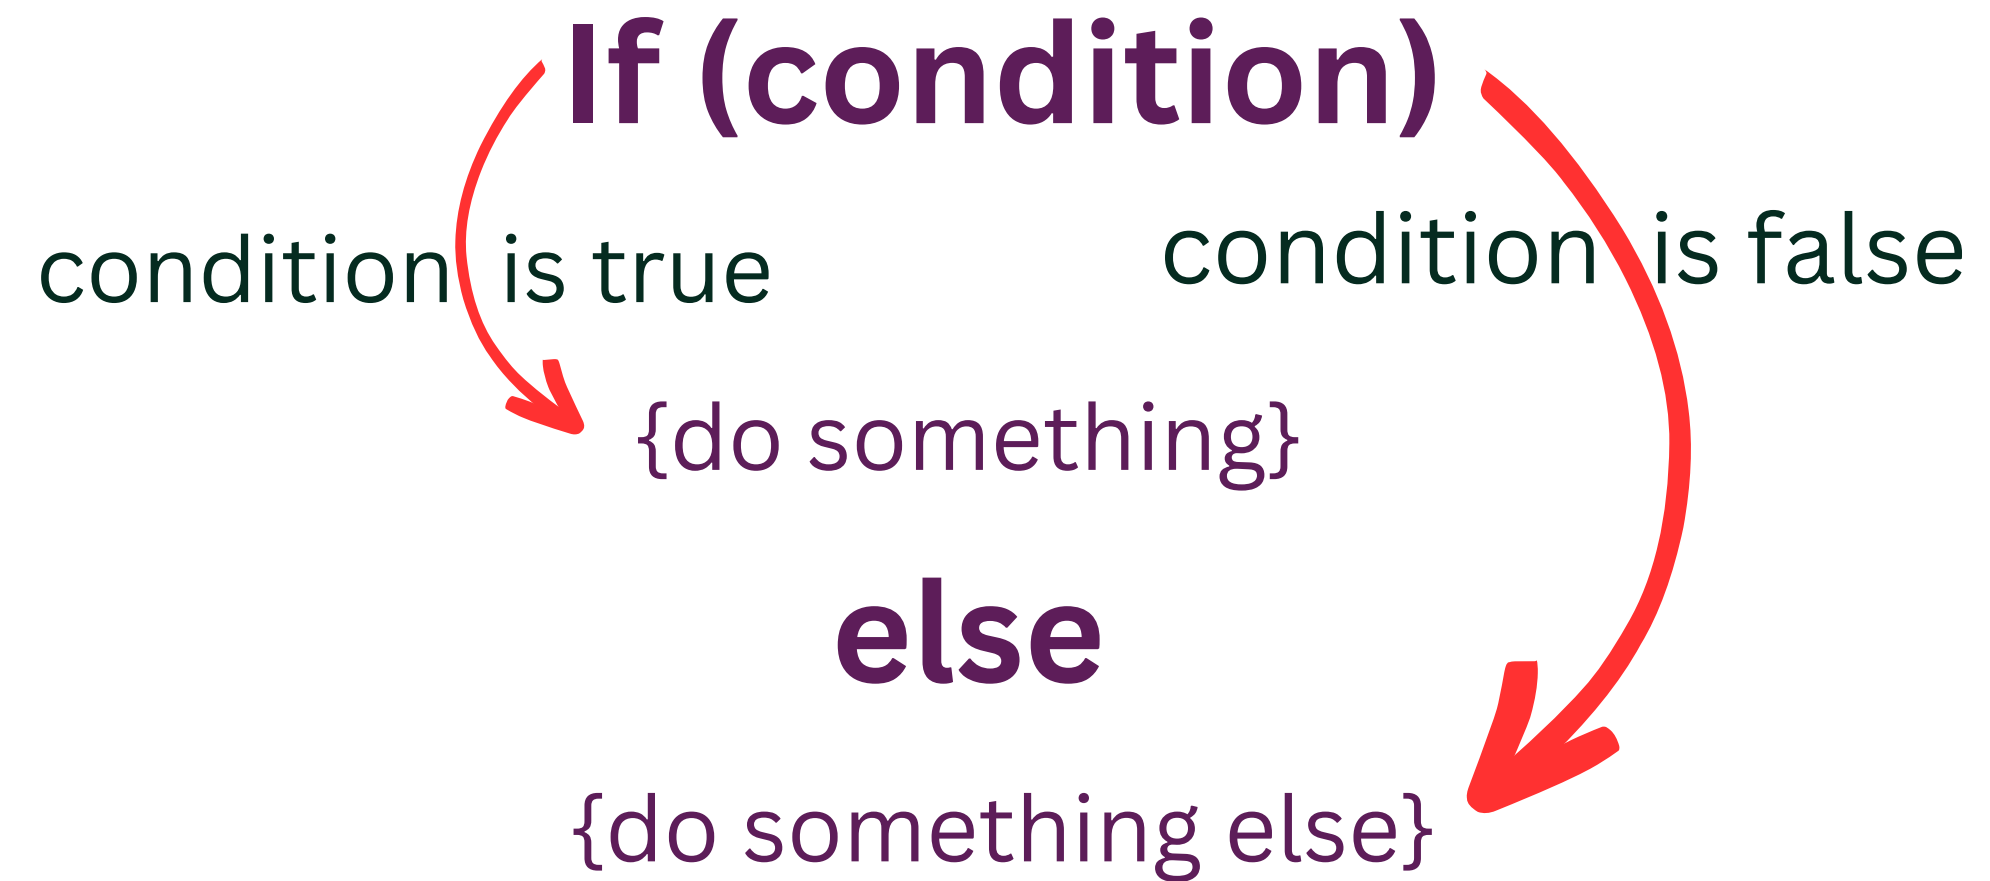

```
int main() {  
    int a = 0;  
    if (a % 2 == 0){  
        cout << "the integer is even\n";  
    }  
}
```

```
int main() {  
    int a = 3;  
    if (a % 2 == 0){  
        cout << "the integer is even\n";  
    }  
}
```

Else statement:

Complementing if

Only evaluated if the condition fails

```
int main() {  
    int a = 3;  
    if (a % 2 == 0) {  
        cout << "the integer is even\n";  
    } else {  
        cout << "the integer is odd\n";  
    }  
}
```

What is the output?

```
int main ()
{
    int a = 4;
    if (a % 2 == 0) {
        cout << "even\n";
        a = a + 1;
    } else {
        cout << "odd\n";
        a = a + 2;
    }
    cout << a << "\n";
}
```

```
int main ()
{
    int a = 4;
    if (a % 2 == 0) {
        cout << "even\n";
        a = a + 1;
    }
    if (a % 2 == 1) {
        cout << "odd\n";
        a = a + 2;
    }
    cout << a << "\n";
}
```

```
int main ()
{
    int a = 4;
    if (a % 2 == 0) {
        cout << "even\n";
        a = a + 2;
    }
    if (a % 2 == 1) {
        cout << "odd\n";
        a = a + 2;
    }
    cout << a << "\n";
}
```

Hint: Think about the sequence in which the code executes

The Outputs

```
even
5
```

```
even
odd
7
```

```
even
6
```

Dangling Else statement

Which if do you think it belongs to?

```
int main ()
{
    int a = 4;
    if (a % 2 == 0) {
        cout << "even\n";
        a = a + 1;
    }
    if (a % 2 == 1) {
        cout << "odd\n";
        a = a + 2;
    } else {
        cout << "will this be printed?\n";
        a = a + 3;
    }
    cout << a << "\n";
}
```

Nested If Else

Sequential Code Evaluation

```
int main ()
{
    int a = 4;
    if (a == 2) {
        cout << "two\n";
    } else {
        if (a == 3) {
            cout << "three\n";
        } else {
            if (a == 4) {
                cout << "four\n";
            }
        }
    }
}
```

```
int main() {
    int a = 4;
    if (a == 2) {
        cout << "two\n";
    } else if (a == 3) {
        cout << "three\n";
    } else if (a == 4) {
        cout << "four\n";
    }
}
```

Control Flow in a nested if else

If (condition)

condition is true

condition is false

{do something}

else if (condition)

{do something else}

else

{do something
even different}

second
condition
is true

rest of the code

Logical Operators

Logical And (&&)

```
int main() {  
    int a = 4;  
    if ((a % 3 == 1) && (a % 4 == 0)) {  
        cout << "both conditions\n";  
    }  
}
```

Logical Or (||)

```
int main() {  
    int a = 4;  
    if ((a % 3 == 1) || (a % 4 == 0)) {  
        cout << "at least one condition\n";  
    }  
}
```

Loops

Repitition at its finest

Short Circuiting

Logical And

(Condition 1): false
(Condition 2): Not evaluated

Logical Or

(Condition 1): true
(Condition 2): Not evaluated

**Calculate the
number of
digits in the
number**

```
int main() {  
    int a = 12345678;  
    int digits = 0;  
    while ( a > 0 ){  
        a = a/10;  
        digits = digits + 1;  
    }  
    cout << digits << '\n';  
}
```

While loop

```
int main() {  
    int a = 0;  
    int sum = 0;  
    while (a < 4) {  
        sum = sum + a;  
        a++;  
    }  
}
```

while (condition is true)
{
 do the stuff inside
}

For loop

Getting everything at once

for (variable definition; condition; increment/decrement){
do various stuff
}

```
int main() {  
    int sum = 0;  
    for (int i = 0; i < 20; i = i + 1){  
        sum = sum + i;  
    }  
}
```

How many times will
this loop iterate?

```
int main() {  
    int u = 0, sum = 120;  
    for (int i = 256, k = 0; i > 0 && sum > 0;  
        k = k + 1, i = i / 2, sum = sum / (k + 1)) {  
        u = u + i + sum;  
    }  
}
```

Ans: 5

So here, $\text{sum} = 120$

$k=0, \Rightarrow \text{sum} = 60$

$k=1, \Rightarrow \text{sum} = 20$

$k=2, \Rightarrow \text{sum} = 5$

$k=3, \Rightarrow \text{sum} = 1$

$k=4, \Rightarrow \text{sum} = 0$

5 iterations.

$i = 256 \Rightarrow i = 128$

$i = 128 \Rightarrow i = 64$

$i = 64 \Rightarrow i = 32$

$i = 32 \Rightarrow i = 16$

$i = 16 \Rightarrow i = 8$

$i = 8 \Rightarrow i = 4$

$i = 4 \Rightarrow i = 2$

$i = 2 \Rightarrow i = 1$

$i = 1 \Rightarrow i = 0$

for 5,
 $\text{sum} > 0$
 $i > 0$
both satisfied

9 iterations.

while loop to for loop

variable declaration needed for while loop

```
while (condition) {  
    do stuff  
    increment/decrement  
}
```

```
for (variable declaration; condition;  
    increment/decrement) {  
    do stuff  
}
```

Arrays

What to Know?

Definition: What exactly are arrays ?

Declaration of Arrays

Example of it's Working

Using array to Find Maximum

What is an Array?

A data structure to store some type of data(One Type in a particular array) in contiguous memory locations , so it's easily accessible .

How an Array is initialized?

- We can create arrays by specifying the **datatype** which we will store in the array, its name and its size(size can be a variable as well).
- Declaration is similar to how we declare any other variable but we have to **write size of array inside square brackets after name..**
- Once you declare array with size n then you can not change the size, so you can **store at max n elements** to your array.

```
DataType ArrayName[size];  
float mark[50];  
int age[n];  
char symbol[9];
```

Example to understand its working

A simple code :

```
#include <iostream>
using namespace std;

int main()
{
    int arr[10];

    arr[0] = 1;
    arr[1] = 2;
    arr[2] = 3;
    arr[3] = 4;

    for (int i = 0; i < 4; i++)
        cout << arr[i] << endl;
    return 0;
}
```

```
1
2
3
4
```

Using Array to Find Maximum Marks:

```
float max_mark = 0;  
for(int i=0;i<50;i++)  
{  
    if(mark[i] > max_mark)  
        max_mark = mark[i];  
}
```
